## Tripods

Las tricetas son acoples colocadas en el extremo del semieje. Son necesarias para transmitir el movimiento de rotación del motor a las ruedas y a la vez se utilizan para absorber los cambios de ángulo que se producen con el uso cotidiano del vehículo por la calzada.

Una triceta proporciona básicamente una suave transmisión de la potencia del semieje diferencial a las ruedas. Las tricetas estándar y las de bujes oscilantes son utilizadas en la mayoría de los vehículos con tracción delantera. Estas piezas están compuestas por tres cojinetes (rodamiento) en los extremos que permite que la triceta se articule con el semieje mientras gira.

Las tricetas son hechas para todas las aplicaciones de vehículos (autos, utilitarios, etc).

Dentro de la variedad de tricetas ETMA están las tricetas de bujes oscilante que permiten un mayor ángulo de trabajo.

Las tricetas son hechas en aceros especiales y mediante un proceso de tratamiento térmico realizado en nuestra propia planta se le confiere a las piezas la tenacidad necesaria en su núcleo y la mayor dureza superficial, de esta manera los componentes quedan preparados para absorber los esfuerzos mecánicos de torsión / corte y los esfuerzos superficiales de presión / rozamiento.

La manufactura ETMA es sinónimo de mayor durabilidad de productos y simplicidad en el mantenimiento de los vehículos.

Tripods joints are used at the inboard end of car driveshafts, they allow for power transmission to the wheels even in case of angle shifting.

Tripod Joints provide a smooth transmission of power from the differential to the wheels.

Standard and High Joint Angle (oblong trunnion) Tripod Joints are used in most from wheel drive vehicles.

They consist of three ball cases (bearings) that surround the trunnions of a central body (spider) allowing the articulation and transmission of power in the side shaft.

ETMA's Tripods are made for all types of vehicles (car, vans, SUVs and others).

ETMA's High Joint Angle tripods allow a smooth transmission of movement at a steeper angle of work.

ETMA's Tripod Joints are produced from specially selected steels. These steels undergo a thoroughly controlled heat treatment (HT) process in ETMA's own Heat Treatment Division.

The achieved steel microstructure conferred on our products by the HT provides a, hard, wear-resistant outer surface. The core remains soft and tough and thus resistant to cut and torsion stresses.

ETMA simplifies and reduces equipment maintenance!.
